

Delivering comprehensive
server analytics using over 150
custom metrics.

Critical Alert Monitoring System (CAMS)

The smartest insurance you can have is by avoiding the disturbance in the first place.

What is CAMS?

CAMS is a licensed monitoring and alerting solution that provides real-time performance tracking and server fault notifications. Pentana Solutions has used over 150 custom metrics to produce baseline analytics for each server. These analytics are used to provide an early warning system and aid outage mitigation.

What are the advantages?

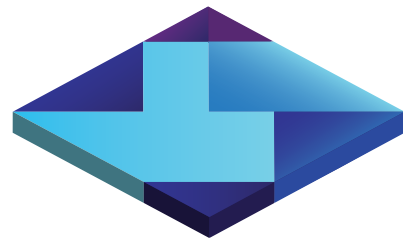

CAMS is capable of providing detailed trend analysis reports based on real-time data gathering from each individual node. This data is available to the customers in the form of detailed graphical monthly reports.

The system anticipates potential faults and thus delivers lower down time. As a result, your business can optimise the level of productivity. Additionally, the detailed trend analysis delivers an in-depth understanding of resource utilisation and allows businesses to meet planned business growth needs by making more informed decisions in regards to future infrastructure developments.

Most importantly, CAMS creates security and peace of mind for the business by knowing that servers are being looked after and monitored for fault conditions.

Who can benefit?

CAMS can be utilised by system administrators to maintain the uptime, performance and security of servers. Additionally, IT managers can utilise the system to understand and justify business upgrade improvements. Pentana Solutions have built CAMS as an optional stand-alone component of MDS.
