

Generate an automated quote
and order the right product the
first time.

The Configurator

An online solution providing your clients with a fit for purpose order.

What is the Configurator?

The Configurator module is an online accessible website, which will allow a user to configure and generate a finalised quote for a specific duty. This process includes providing the user with a selection of performance, fuel system, voltage, emission and optional accessory options. Once the Configurator calculates the selected requirements, the system provides the user with a final order fit for purpose.

What are the advantages?

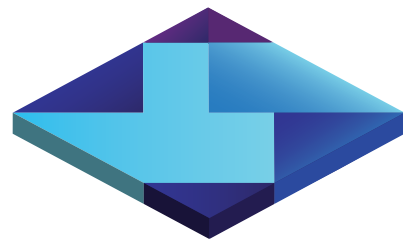

The Configurator has been developed using the most accurate engineer intelligence technology, therefore engineering experts are no longer required to commit hours of time to manually calculate the cost of each order.

This software takes away the technical difficulty associated with generating order quotations, providing users with the ability to build their own quotes automatically based on their individual requirements.

Through the automation and simplicity of these processes, businesses can expect to realise greater efficiency in sales and customer satisfaction. Furthermore, the Configurator will deliver greater efficiency and accuracy to the overall manufacturing processes of the business.

Who can benefit?

Parts managers and sales staff can benefit from the reduced engineering cost and improved customer satisfaction associated with the Configurator. Pentana Solutions have built the Configurator as an optional stand-alone component of MDS.
