An integrated solution to handle all of your specialty vehicle build requirements

Vehicle Management

Complete tracking of your vehicles from order to end of service.

What is Vehicle Management?

Pentana Solutions' Vehicle Management module provides tracking of vehicle supply process from the initial customer order, through to retail delivery, and on to the end of life of the vehicle. Both the internal users and the dealer network module can see visibility on the current status, condition, and future estimated delivery dates at all times. The Vehicle Management module can be integrated with parts, warranty and finance modules to provide a single complete solution to vehicle importation and distribution businesses.
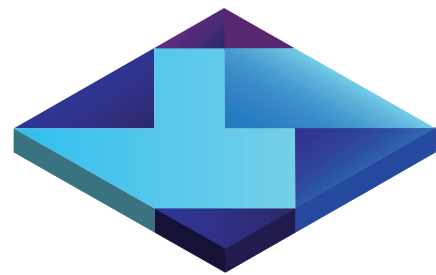

What are the advantages?

Vehicle Management has been designed and developed to manage the procurement, sales and delivery of units in a market. The module supports a wide range of vehicles and similar units, with flexible configuration of models, colours, trims, factory options, local options and a wide array of pricing functionality.

Vehicle Management provides full visibility of all units in the supply chain by allowing you to define all activities and expected lead times involved. These activities are then updated and monitored for changes, with the information easily available for use in allocations, sales and reporting. The dealer interaction can be configured to allow restricted visibility by model, location, status to ensure the correct information is available online in real-time, and optionally allow dealers to self-allocate from within nominated available stock or place indent orders as required.

Who can benefit?

Parts Managers and Sales Staff can utilise the Vehicle Management system to improve efficiency, job control and customer satisfaction through increased visibility. Pentana Solutions has built Vehicle Management as an optional stand-alone component of MDS.
