

**Avoid an emergency
ambulance call for your
server.**

**Ensure your server life is
long and prosperous
using Heartbeat.**

Heartbeat

Ensuring your server is alive and kicking.

What is Heartbeat?

A solution that provides a 360-degree view of server performance highlighting any issues and potential problems and risks. The importance of a server is vital to the success of all tasks with in a business.

Why would I need it?

If you like to know how things work, you're interested into the technical reasons as to why something is broken or has room for improvement then Heartbeat is for you. The three main features of Heartbeat allow you to pro-actively monitor real-time server performance, receive server status reports and an action list of areas to investigate.

Considering the business value a server provides, it's vital that any performance risks to the server are monitored and tracked. This in-depth tracking and reporting of CPU usage, memory usage (RAM) including disk space information (storage) allows transparency to what is actually happening in the back end. We know you want all of the technical information.

Heartbeat does make it easy. Delivering an action list which provides efficiency through a single alert identifying where you should investigate, instead of getting alerts for everything affected.

Tell me more.

You're now able to increase your business performance through improved operational infrastructure. If you value server reliability, performance and wish to confidentially approach future growth initiatives, Heartbeat will ensure your systems have a constant pulse.
