

Probably the most
valuable tool you will
own and it's not found in
a tool chest.

Technician allocation,
left, right and centre.

Workshop Control

Assisting the Workshop Foreman on a day-to-day basis.

What is Workshop Control?

Workshop Control provides the controller of your workshop a display of the workload for each technician, including the job status. This information is the output of time allocation for each of your technicians previously entered in the home screen. If improving the productivity of technicians is a priority then Workshop Control is a solution for you.

Tell me more about it.

Ultimately, if a pin board, in-tray, filing system or spreadsheet is how you manage your technicians job allocation then consider Workshop Control. Also, if a high class and superior service centre is the overall goal, the home screen of Workshop Control is perfectly colour coded to provide a quick overview all can staff understand.

As you navigate through each of the screens, colours and lines display the status of each job at hand. A repair order linked to the job allows further information to be seen on what needs to be done.

A cleverly developed monitor mode offers complete visibility on the jobs at hand, a great tool to display for everyone at the dealership to see. For the technician, they can then see what job they have, the time-line and their next job ensuring the day ahead won't be full of surprises. A technician time schedule can be seen as having jobs overdue or even being on a break.

To wrap it up.

Capture every moment of your technicians time, allocate accordingly and ensure you're maximising the amount of cars coming in, and speeding out. With efficiency in mind, your workshop controller will finally have complete control at their fingertips for everything happening in the department.
